

Equacions del moviment:
$$y = y_0 + N_0 (t-t_0) + \frac{1}{2}g(t-t_0)^2$$

$$N = N_0 + g(t-t_0)$$

$$y = 200 + 30t - 5t^2$$

 $x = 30 - 10t$

(b) Busquem el temps que tarda en recorrer els ultims 50m Δt = t(y=0) - t (y=50m)

$$5t^2 - 30t - 150 = 0$$

$$5t^{2}-30t-150=0 \Rightarrow t^{2}-6t-30=0$$

 $t=\frac{6t\sqrt{36-4.(-30)}}{2}=\frac{6t\cdot 12.5}{2}=\frac{9.25}{2}$

$$S: Y=0 \Rightarrow 0=200+30t-5t^2 \Rightarrow t^2-6t-40=0$$

$$t = \frac{6 \pm \sqrt{36 - 4(-40)}}{2} = \frac{6 \pm 14}{2} = \sqrt{\frac{106}{-46}}$$

Com N= 30-10t i y= 200+30t-5t2

Tenim -40=30-10t => -10t=-70 => t= 75

Reemplaçant-ho a la segona equació:

$$y = 200 + 30.7 - 57^2 = 165 m$$
